Abstract. The present research deals in two dimensional (2D) transversely isotropic magneto generalized thermoelastic solid without energy dissipation and with two temperatures due to time harmonic sources in Lord-Shulman (LS) theory of thermoelasticity. The Fourier transform has been used to find the solution of the problem. The displacement components, stress components and conductive temperature distribution with the horizontal distance are calculated in transformed domain and further calculated in the physical domain numerically. The effect of two temperature are depicted graphically on the resulting quantities.

Keywords: transversely isotropic Magneto thermoelastic; mechanical and thermal stresses; inclined load; time harmonic source

1. Introduction

The classical theory of elasticity deals with the systematic study of the stress and strain distribution that develops in an elastic body due to the application of forces or change in temperature. A lot of research and attention has been given to deformation and heat flow in a continuum using thermoelasticity theories during the past few years. It is well known that all the rotating large bodies have an angular velocity, as well as magnetism, therefore, the thermoelastic interactions in a rotating medium under magnetic field is of importance. When sudden heat/external force is applied in a solid body, it transmits time harmonic wave by thermal expansion. The change at some point of the medium is beneficial to detect the deformed field near mining shocks, seismic and volcanic sources, thermal power plants, high-energy particle accelerators, and many emerging technologies. The study of time harmonic source is one of the broad and dynamic areas of continuum dynamics. Therefore, in an unbounded rotating elastic medium with angular velocity, with two temperature, rotation and relaxation time and without energy dissipation in generalized thermoelasticity has been studied in this research.

Marin (1997) had proved the Cesaro means of strain and kinetic energies of dipolar bodies with finite energy. Ailawalia et al. (2010) had studied a rotating generalized thermoelastic medium in presence of two temperatures beneath hydrostatic stress and gravity with different kinds of sources

*Associate Professor, E-mail: parveenlata@pbi.ac.in
using integral transforms. Singh and Yadav (2012) solved the transversely isotropic rotating magnetothermoelastic medium equations by cubic velocity equation of three plane waves without anisotropy, rotation, and thermal and magnetic effects. Banik and Kanoria (2012) studied the thermoelastic interaction in an isotropic infinite elastic body with a spherical cavity for the TPL (Three-Phase-Lag) heat equation with two-temperature generalized thermoelasticity theory and has shown variations between two models: the two-temperature GN theory in presence of energy dissipation and two-temperature TPL model and has shown the effects of ramping parameters and two-temperature.

Mahmoud (2012) had considered the impact of rotation, relaxation times, magnetic field, gravity field and initial stress on Rayleigh waves and attenuation coefficient in an elastic half-space of granular medium and obtained the analytical solution of Rayleigh waves velocity by using Lame’s potential techniques. Abd-alla and Alshaikh (2015) had discussed the influence of magnetic field and rotation on plane waves in transversely isotropic thermoelastic medium under the GL theory in presence of two relaxation times to show the presence of three quasi plane waves in the medium. Marin et al. (2013) has modelled a micro stretch thermoelastic body with two temperatures and eliminated divergences among the classical elasticity and research. Keivani et al. (2014) discussed the forced vibration problem of an Euler-Bernoulli beam with a semi-infinite field by considering it a BVP in the frequency domain.

Marin et al. (2017) studied the GN-thermoelastic theory for a dipolar body using mixed initial BVP and proved a result of Hölder’s-type stability. Latina (2018) studied the impact of energy dissipation on plane waves in sandwiched layered thermoelastic medium of uniform thickness, with two temperature, rotation and Hall current in the context of GN Type-II and Type-III theory of thermoelasticity. Ezzat and El-Bary (2017) had applied the magneto-thermoelasticity model to a one-dimensional thermal shock problem of functionally graded half-space of based on memory-dependent derivative. Hassan et al. (2018) investigated water base nanofluid flow over wavy surface in a porous medium (copper oxides particles) of spherical packing beds. Kumar et al.
Thermomechanical interactions in a transversely isotropic magneto thermoelastic solids... investigated the deformations in a homogeneous transversely isotropic magneto-Visco thermoelastic medium under GN type I and II theories in presence of rotation and two temperature with thermomechanical sources. Despite of this several researchers worked on different theory of thermoelasticity as Marin (1997), Marin (2008), Atwa (2014), Marin (2016), Marin and Baleanu (2016), Bijarnia and Singh (2016), Ezzat et al. (2016), Ezzat et al. (2012), Ezzat et al. (2015), Ezzat and El-Bary (2016), Ezzat and El-Bary (2017), Ezzat et al. (2017), Chauthale et al. (2017) and Shahani and Torki (2018), Lata and Kaur (2019). Despite of these, not much work has been carried out in thermomechanical interactions in transversely isotropic magneto thermoelastic solid with two temperature, rotation and relaxation time and without energy dissipation due to time harmonic source in generalized LS theories of thermoelasticity. Keeping these considerations in mind, analytic expressions for the displacements, stresses and temperature distribution in two-dimensional homogeneous, transversely isotropic magneto-thermoelastic solids with two temperatures and without energy dissipation, rotation and various frequencies of time harmonic source.

2. Basic equations

For a general anisotropic thermoelastic medium, the constitutive relations in absence of heat source and body forces following Green and Naghdi (1992) are given by

\[ t_{ij} = C_{ijkl} e_{kl} - \beta_{ij} T, \]  

and equation of motion as described by Schoenberg and Censor (1973) for a uniformly rotating medium with an angular velocity and Lorentz force which governs the dynamic displacement \( u \) is

\[ t_{ij,j} + F_i = \rho \{ \ddot{u}_i + (\Omega \times (\Omega \times u)_i) + (2\Omega \times \dot{u})_i \}, \]  

where \( \Omega = \Omega n \), \( n \) is a unit vector representing the direction of axis of rotation. The term \( \Omega \times (\Omega \times u) \) is the additional centripetal acceleration due to the time-varying motion only, and the term \( 2\Omega \times \dot{u} \) is the Coriolis acceleration. All other terms are as usual \( F_i = \mu_0 (j \times \vec{H}_0) \).

The heat conduction equation without energy dissipation using Lord-Shulman (1967) model is

\[ K_{ij} \varphi_{ij} + \rho (Q + \tau_0 \dot{Q}) = \beta_{ij} T_0 (\dot{e}_{ij} + \tau_0 \dot{e}_{ij}) + \rho C_E (T + \tau_0 \dot{T}), \]  

where

\[ \beta_{ij} = C_{ijkl} \alpha_{ij}, \]  

\[ e_{ij} = \frac{1}{2} (u_{ij} + u_{ji}), \quad i,j = 1,2,3. \]  

\[ T = \varphi - a_{ij} \varphi_{ij} \]

\[ \beta_{ij} = \beta_i \delta_{ij}, \quad K_{ij} = K_i \delta_{ij}, \quad i \text{ is not summed.} \]

Here \( C_{ijkl} (C_{ijkl} = C_{klji} = C_{jikl} = C_{jikl}) \) are elastic parameters.

3. Formulation and solution of the problem

We consider a homogeneous transversely isotropic magneto-thermoelastic medium, permeated
by an initial magnetic field $\vec{H}_0 = (0, H_0, 0)$ acting along $y$-axis. The rectangular Cartesian coordinate system $(x, y, z)$ having origin on the surface ($z = 0$) with $z$-axis pointing vertically into the medium is introduced. The surface of the half-space is subjected to a thermomechanical force acting at $z = 0$.

In addition, we consider that $\Omega = (0, \Omega, 0)$.

From the generalized Ohm’s law

$$J_z = 0$$

The density components $J_1$ and $J_3$ are given as

$$J_1 = -\varepsilon_0 \mu_0 H_0 \frac{\partial^2 w}{\partial z^2}, \quad (6)$$

$$J_3 = \varepsilon_0 \mu_0 H_0 \frac{\partial^2 u}{\partial x^2}. \quad (7)$$

In addition, the equations of displacement vector $(\vec{u}, \vec{v}, \vec{w})$ and conductive temperature $\varphi$ for transversely isotropic thermoelastic solid in presence of two temperature and without energy dissipation are

$$\vec{u} = u(x, z, t), \vec{v} = 0, \vec{w} = w(x, z, t) \text{ and } \varphi = \varphi(x, z, t). \quad (8)$$

Now using the proper transformation on equations (1)-(3) following Slaughter (2002) are as under:

Eqns. (1) - (3) with the aid of (8), yield

$$C_{11} \frac{\partial^2 u}{\partial x^2} + C_{13} \frac{\partial^2 w}{\partial x \partial z} + C_{44} \left( \frac{\partial^2 u}{\partial z^2} + \frac{\partial^2 w}{\partial x \partial z} \right) - \beta_1 \frac{\partial}{\partial x} \left( \varphi - \left( a_1 \frac{\partial^2 \varphi}{\partial x^2} + a_3 \frac{\partial^2 \varphi}{\partial z^2} \right) \right) - \mu_0 J_3 H_0 = \rho \frac{\partial^2 u}{\partial t^2} - \Omega^2 u + 2\Omega \frac{\partial w}{\partial t}, \quad (9)$$

$$K_1 \frac{\partial^2 \varphi}{\partial x^2} + K_3 \frac{\partial^2 \varphi}{\partial z^2} + \rho \varphi + \tau_0 Q \right) = \rho C_e \left( \dot{T} + \tau_0 \dot{T} \right) + T_0 \frac{\partial}{\partial t} \left( \beta_1 \left( 1 + \tau_0 \frac{\partial}{\partial x} \right) \frac{\partial \varphi}{\partial x} + \beta_3 \left( 1 + \tau_0 \frac{\partial}{\partial z} \right) \frac{\partial \varphi}{\partial z} \right), \quad (10)$$

and

$$t_{11} = C_{11} e_{11} + C_{13} e_{13} - \beta_1 T, \quad (12)$$

$$t_{33} = C_{13} e_{11} + C_{33} e_{33} - \beta_3 T, \quad (13)$$

$$t_{13} = 2C_{44} e_{13}, \quad (14)$$
where

\[ T = \varphi - \left( a_1 \frac{\partial^2 \varphi}{\partial x^2} + a_3 \frac{\partial^2 \varphi}{\partial z^2} \right), \]

\[ \beta_1 = (C_{11} + C_{12})a_1 + C_{13}a_3, \]

\[ \beta_3 = 2C_{13}a_1 + C_{33}a_3, \]

We consider that medium is initially at rest. Therefore, the preliminary and symmetry conditions are given by

\[ u(x, z, 0) = 0 = \dot{u}(x, z, 0), \]

\[ w(x, z, 0) = 0 = \dot{w}(x, z, 0), \]

\[ \varphi(x, z, 0) = 0 = \dot{\varphi}(x, z, 0) \text{ for } z \geq 0, -\infty < x < \infty, \]

\[ u(x, z, t) = w(x, z, t) = \varphi(x, z, t) = 0 \text{ for } t > 0 \text{ when } z \rightarrow \infty. \]

Assuming the time harmonic behaviour as

\[ (u, w, \varphi, Q)(x, z, t) = (u, w, \varphi, Q)(x, z)e^{i\omega t}, \tag{15} \]

where \( \omega \) is the angular frequency.

To simplify the solution, mention below dimensionless quantities are used

\[ x' = \frac{x}{L}, \quad u' = \frac{\rho c_1^2}{L\beta_1 T_0}u, \quad t' = \frac{c_1}{L}t, \]

\[ w' = \frac{\rho c_1^2}{L\beta_1 T_0}w, \quad T' = \frac{T}{T_0}, t'_{11} = \frac{t_{11}}{\beta_1 T_0}, \quad t'_{33} = \frac{t_{33}}{\beta_1 T_0}, \]

\[ t'_{31} = \frac{t_{31}}{\beta_1 T_0}, \quad \varphi' = \frac{\varphi}{T_0}, \quad a_1' = \frac{a_1}{L^2}, \quad z' = \frac{z}{L}, \]

\[ a_3' = \frac{a_3}{L^2}, \quad h' = \frac{h}{H_0}, \quad \Omega' = \frac{L}{C_1} \Omega. \tag{16} \]

Making use of (16) in Eqs. (9)–(11), after suppressing the primes, yield

\[ \frac{\partial^2 u}{\partial x^2} + \delta_3 \frac{\partial^2 w}{\partial x \partial z} + \delta_2 \left( \frac{\partial^2 u}{\partial z^2} + \frac{\partial^2 w}{\partial x \partial z} \right) - \frac{\rho}{\beta_1} \left( \varphi - \left( a_1 \frac{\partial^2 \varphi}{\partial x^2} + a_3 \frac{\partial^2 \varphi}{\partial z^2} \right) \right) = \left( \frac{\rho \delta_5^2 h_0 \Omega^2}{\rho} + 1 \right) \left( -\omega^2 u \right) - \Omega^2 u + \frac{2\Omega i \omega w}{\Omega^2}. \tag{17} \]

\[ \delta_1 \frac{\partial^2 u}{\partial x \partial z} + \delta_2 \frac{\partial^2 u}{\partial x^2} + \delta_3 \frac{\partial^2 w}{\partial x \partial z} - \frac{\beta_3}{\beta_1} \frac{\partial}{\partial x} \left( \varphi - \left( a_1 \frac{\partial^2 \varphi}{\partial x^2} + a_3 \frac{\partial^2 \varphi}{\partial z^2} \right) \right) = \left( \frac{\rho \delta_5^2 h_0 \Omega^2}{\rho} + 1 \right) \left( -\omega^2 w \right) - \Omega^2 w + \frac{2\Omega i \omega u}{\Omega^2}. \tag{18} \]

\[ \frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial z^2} + \rho \left( 1 + \tau_0 \frac{c_1}{L} i \omega \right) Q = \delta_5 \frac{\partial}{\partial x} \left( 1 + \tau_0 \frac{c_1}{L} i \omega \right) \left( \varphi - a_1 \frac{\partial^2 \varphi}{\partial x^2} - a_3 \frac{\partial^2 \varphi}{\partial z^2} \right) + \delta_6 \omega \left( 1 + \frac{c_1}{L} i \omega \right) \left[ \beta_1 \frac{\partial}{\partial x} + \beta_3 \frac{\partial}{\partial z} \right]. \tag{19} \]

where
\[
\delta_1 = \frac{c_{13} + c_{44}}{c_{11}}, \quad \delta_2 = \frac{c_{44}}{c_{11}}, \quad \delta_3 = \frac{c_{33}}{c_{11}}, \quad \delta_4 = \frac{c_{13}}{c_{11}}, \\
\delta_5 = \frac{\rho c_e c_1 L}{K_1}, \quad \delta_6 = -\frac{T_0 \beta_1 L}{\rho c_1 K_1}
\]

Apply Fourier transforms defined by
\[
f(\xi, z, \omega) = \int_{-\infty}^{\infty} f(x, z, \omega) e^{i\xi x} dx \tag{20}
\]

On Eqs. (17)–(19), we obtain a system of equations
\[
[-\xi^2 + \delta_2 D^2 + \delta_7 \omega^2 + \Omega^2] \hat{u}(\xi, z, \omega) + [\delta_4 D i \xi + \delta_2 D i \xi - 2\Omega i \omega] \hat{w}(\xi, z, \omega) + (-i\xi) [1 + a_1 \xi^2 - a_3 D^2] \hat{\phi}(\xi, z, \omega) = 0, \tag{21}
\]
\[
[\delta_1 D i \xi + 2\Omega i \omega] \hat{u}(\xi, z, \omega) + [-\delta_2 \xi^2 + \delta_3 D^2 + \delta_7 \omega^2 + \Omega^2] \hat{w}(\xi, z, \omega) - \frac{\beta_3}{\beta_1} D [1 + a_1 \xi^2 - a_3 D^2] \hat{\phi}(\xi, z, \omega) = 0, \tag{22}
\]
\[
[-\delta_6 \omega \delta_\theta \beta_1 \xi] \hat{u}(\xi, z, \omega) + [\delta_6 i \omega \delta_\theta \beta_3 D] \hat{\phi}(\xi, z, \omega) + \left[\xi^2 - \frac{K_3}{K_1} D^2 + \delta_5 \delta_\theta i \omega (1 + a_1 \xi^2 - a_3 D^2)\right] \hat{\phi}(\xi, z, \omega) = \rho \delta_\theta \hat{Q}(\xi, z, \omega), \tag{23}
\]
where
\[
\delta_7 = \frac{\varepsilon_0 \mu_0^2 H_0^2 \rho}{L} + 1, \quad \delta_\theta = 1 + \tau_0 \frac{c_1}{L} i \omega.
\]

By taking \(\hat{Q}(\xi, z, s) = 0\), the non trivial solution of homogeneous equations (21)-(23) exists if determinant of coefficient matrix \((\hat{u}, \hat{w}, \hat{\phi})\) of (21)-(23) is equal to zero i.e.,
\[
AD^6 + BD^4 + CD^2 + E = 0, \tag{24}
\]
where
\[
D = \frac{d}{dx}, \\
A = \delta_2 \delta_3 \delta_\theta - \delta_5 \delta_2 \frac{\beta_3}{\beta_1} a_3, \\
B = \delta_3 \delta_1 \delta_7 - a_3 \delta_1 \delta_5 \frac{\beta_3}{\beta_1} + \delta_2 \delta_3 \delta_6 + \delta_2 \delta_7 \delta_3 - \delta_5 \delta_9 \delta_2 - \delta_8 \delta_1 i \xi \delta_7 + \delta_8 \delta_4 \frac{\beta_3}{\beta_1} a_3 - a_3 \xi^2 \delta_5 \delta_1 - a_3 \delta_3 \delta_4 i \xi, \\
C = \delta_3 \delta_1 \delta_6 + \delta_1 \delta_3 \delta_7 - \delta_1 \delta_5 \delta_9 + \delta_2 \delta_6 \delta_3 + \delta_4 \delta_9 \delta_3 - \delta_8 \delta_1 i \xi \delta_6 - 4 \Omega^2 \omega^2 \theta_7 + \delta_2 \delta_1 i \xi \delta_5 - \delta_2 \delta_4 \delta_3 - a_3 \delta_4 i \xi \delta_3, \\
E = \delta_3 \delta_1 \delta_6 - 4 \Omega^2 \omega^2 \theta_6 - \delta_2 \delta_4 \delta_3,
\[ \begin{align*}
\theta_1 &= \xi^2 + \delta_7 \omega^2 + \Omega^2, \\
\theta_2 &= -i \xi (1 + a_1 \xi^2), \\
\theta_3 &= -\delta_2 \xi^2 + \delta_7 \omega^2 + \Omega^2, \\
\theta_4 &= -\delta_6 \delta_8 \omega \beta_1 \xi, \\
\theta_5 &= \delta_6 \delta_8 i \omega \beta_3, \\
\theta_6 &= \xi^2 + \delta_7 \delta_8 i \omega (1 + a_1 \xi^2), \\
\theta_7 &= -\frac{K_3}{K_1} - a_3 \delta_7 \delta_8 i \omega, \\
\theta_8 &= \delta_1 i \xi, \\
\theta_9 &= -(1 + a_1 \xi^2) \frac{\beta_3}{\beta_1}.
\end{align*} \]

The roots of the Eq. (24) are \( \pm \lambda_j \) (j = 1, 2, 3), the solution of the Eq. (24) is calculated by using the radiation conditions that \( \bar{u}, \bar{w}, \bar{\phi} \rightarrow 0 \) as \( z \rightarrow \infty \) yields
\[ \begin{align*}
\bar{u}(\xi, z, \omega) &= \sum_{j=1}^{3} A_j e^{-\lambda_j z}, \\
\bar{w}(\xi, z, \omega) &= \sum_{j=1}^{3} d_j A_j e^{-\lambda_j z}, \\
\bar{\phi}(\xi, z, \omega) &= \sum_{j=1}^{3} l_j A_j e^{-\lambda_j z},
\end{align*} \]

where \( A_j(\xi, \omega), j = 1, 2, 3 \) being undetermined constants and \( d_j \) and \( l_j \) are given by
\[ \begin{align*}
d_j &= \frac{\delta_2 \xi \lambda_j^4 + (\theta_7 \theta_3 - \delta_1 \theta_4 i \xi + \delta_2 \theta_6) \lambda_j^2 + \theta_4 \theta_6 - \theta_4 \theta_2}{\left( \delta_3 \theta_7 - \frac{\beta_3}{\beta_1} \delta_3 \theta_5 \right) \lambda_j^4 + (\delta_3 \theta_6 + \theta_3 \theta_7 - \theta_3 \theta_9) \lambda_j^2 + \theta_3 \theta_6}, \\
l_j &= \frac{\delta_2 \delta_3 \lambda_j^4 + (\delta_2 \xi \lambda_0 + \theta_1 \theta_3 - \delta_1 \theta_8 i \xi) \lambda_j^2 - 4 \Omega^2 \omega^2 + \theta_3 \theta_1}{\left( \delta_3 \theta_7 - \frac{\beta_3}{\beta_1} \delta_3 \theta_5 \right) \lambda_j^4 + (\delta_3 \theta_6 + \theta_3 \theta_7 - \theta_3 \theta_9) \lambda_j^2 + \theta_3 \theta_6}.
\end{align*} \]

4. **Boundary conditions**

Thermal source and normal force are applied on the half-space (z = 0) surface.
\[ e_{33}(x, z, t) = -F_1 \psi_1(x) e^{i\omega t}, \]
\[ t_{31} = 0, \]  
\[ \frac{\partial \varphi}{\partial z}(x, z, t) = F_2 \psi_2(x) e^{i\omega t}, \]  
where \( F_1 \) is the magnitude of the force applied, \( F_2 \) is the constant temperature applied on the boundary, \( \psi_1(x) \) specifies the source distribution function along \( x \)-axis, \( \psi_2(x) \) specifies the source distribution function along \( z \)-axis.

Applying the Laplace and Fourier transform defined by (19) and (20) on the boundary conditions (28)-(30), (12)-(14) and with the help of Eqs. (25)-(27), we find the components of displacement, stress and conductive temperature as

\[
\hat{\varphi} = \frac{F_1 \hat{\psi}_1(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t} + \frac{F_2 \hat{\psi}_2(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t},
\]

\[
\hat{\psi} = \frac{F_1 \hat{\psi}_1(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} d_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t} + \frac{F_2 \hat{\psi}_2(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} d_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t},
\]

\[
\hat{\varphi} = \frac{F_1 \hat{\psi}_1(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} l_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t} + \frac{F_2 \hat{\psi}_2(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} l_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t},
\]

\[
\hat{\varphi} = \frac{F_1 \hat{\psi}_1(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} n_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t} + \frac{F_2 \hat{\psi}_2(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} n_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t},
\]

\[
\hat{\varphi} = \frac{F_1 \hat{\psi}_1(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} m_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t} + \frac{F_2 \hat{\psi}_2(\xi)}{\Gamma} \left[ \sum_{i=1}^{3} m_i \Gamma_i e^{-\lambda_i \xi} \right] e^{i\omega t},
\]

where

\[
\Gamma_{11} = -N_2 R_3 + R_2 N_3,
\]
\[
\Gamma_{12} = N_1 R_3 - R_1 N_3,
\]
\[
\Gamma_{13} = -N_1 R_2 + R_1 N_2,
\]
\[
\Gamma_{21} = M_2 N_3 - N_2 M_3,
\]
\[
\Gamma_{22} = -M_1 N_3 + N_1 M_3,
\]
\[
\Gamma_{23} = M_1 N_2 - N_1 M_2,
\]
\[
\Gamma = -M_1 \Gamma_{11} - M_2 \Gamma_{12} - M_3 \Gamma_{13}.
\]
\[ N_j = -\delta_2 \lambda_j + i \xi d_j, \]
\[ M_j = i \xi - \delta_3 d_j \lambda_j - \frac{b_2}{b_1} l_j [(1 + a_3 \xi^2) - a_3 \lambda_j^2], \]
\[ R_j = -\lambda_j l_j [(1 + a_3 \xi^2) - a_3 \lambda_j^2], \]
\[ S_j = -i \xi - \delta_3 d_j \lambda_j - l_j [(1 + a_3 \xi^2) - a_3 \lambda_j^2]. \]

5. Special Cases

a. Mechanical force on half-space surface

By taking \( F_2 = 0 \) in Eqs. (31)-(36), we obtain the components of displacement, normal stress, tangential stress and conductive temperature due to mechanical force.

b. Thermal source on the half-space surface

By considering \( F_1 = 0 \) in Eqs. (31)-(36), we obtain the components of displacement, normal stress, tangential stress and conductive temperature due to thermal source.

5.1 Concentrated force

We obtained the solution with concentrated normal force on the half space by taking
\[ \psi_1(x) = \delta(x), \psi_2(x) = \delta(x) \] (37)

Applying Fourier transform defined by (19)-(20) and (37), we obtain
\[ \widehat{\psi}_1(\xi) = 1, \widehat{\psi}_2(\xi) = 1. \] (38)

Using (38) in (31)-(36), the components of displacement, stress and conductive temperature are obtained.

5.2 Uniformly distributed force

We obtained the solution with uniformly distributed force applied on the half space by taking
\[ \psi_1(x), \psi_2(x) = \begin{cases} 1 & \text{if } |x| \leq m \\ 0 & \text{if } |x| > m \end{cases} \] (39)

The Fourier transforms of \( \psi_1(x) \) and \( \psi_2(x) \) with respect to the pair \((x, \xi)\) for the case of a uniform strip load of non-dimensional width \( 2m \) applied at origin of coordinate system \( x = z = 0 \) in the dimensionless form after suppressing the primes becomes
\[ \widehat{\psi}_1(\xi) = \widehat{\psi}_2(\xi) = \left\{ \frac{2 \sin(\xi m)}{\xi}, \xi \neq 0 \right\} \] (40)

Using (40) in (31)-(36), the components of displacement, stress and conductive temperature are obtained.

5.3 Linearly distributed force

We obtained the solution with linearly distributed force applied on the half space having \( 2m \) as
the width of the strip load by taking
\[
\{\psi_1(x), \psi_2(x)\} = \begin{cases} 
1 - \frac{|x|}{m} & \text{if } |x| \leq m \\
0 & \text{if } |x| > m 
\end{cases}
\] (41)

By using (15) and applying the transform defined by (20) on (41), we get
\[
\hat{\psi}_1(\xi) = \hat{\psi}_2(\xi) = \begin{cases} 
2\left(1 - \cos\left(\frac{m}{\xi}\right)\right) & \xi \neq 0 
\end{cases}
\] (42)

Using (42) in (31)-(36), the components of displacement, stress and conductive temperature are obtained.

6. Inversion of the transformation

For obtaining the result in physical domain, invert the transforms in Eqs. (31)-(36) using
\[
\tilde{f}(x, z, \omega) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i\xi x} \hat{f}(\xi, z, \omega) d\xi = \frac{1}{2\pi} \int_{-\infty}^{\infty} |\cos(\xi x) f_0 - i\sin(\xi x) f_0| d\xi,
\]
where \(f_0\) is odd and \(f_0^e\) is the even parts of \(\hat{f}(\xi, z, s)\) respectively.

7. Numerical results and discussion

To demonstrate the theoretical results and effect of rotation, relaxation time and two temperature, the physical data for cobalt material, which is transversely isotropic, is taken from Dhaliwal & Singh (1980) is given as
\[
\begin{align*}
c_{11} &= 3.07 \times 10^{11} Nm^{-2}, \\
c_{33} &= 3.581 \times 10^{11} Nm^{-2}, \\
c_{13} &= 1.027 \times 10^{10} Nm^{-2}, \\
c_{44} &= 1.510 \times 10^{11} Nm^{-2}, \\
\beta_1 &= 7.04 \times 10^6 Nm^{-2}deg^{-1}, \\
\beta_3 &= 6.90 \times 10^6 Nm^{-2}deg^{-1}, \\
\rho &= 8.836 \times 10^3 Kg m^{-3}, \\
C_E &= 4.27 \times 10^2 Kg m^{-1} deg^{-1}, \\
K_1 &= 0.690 \times 10^2 W m^{-1} K deg^{-1}, \\
K_3 &= 0.690 \times 10^2 W m^{-1} K^{-1}, \\
T_0 &= 298 K, \\
H_0 &= 1 J m^{-1} nx^{-1}, \\
\epsilon_0 &= 8.838 \times 10^{-12} F m^{-1}, \\
L &= 1.
\end{align*}
\]

Using the above values, the graphical representations of displacement component \(u\), normal displacement \(w\), conductive temperature \(\varphi\), stress components \(t_{11}\), \(t_{13}\) and \(t_{33}\) for transversely isotropic magneto-thermoelastic medium have been studied and the effect of inclination and rotation has been depicted.

Case 1: Mechanical force with rotation and with two temperature

Sub case i: Concentrated force

Figs. 1-6 shows the variations of the displacement components \((u \text{ and } w)\). Conductive temperature \(\varphi\) and stress components \((t_{11}, t_{13} \text{ and } t_{33})\) for transversely isotropic magneto-thermoelastic medium with mechanical force and concentrated force and with combined effects of two temperature, relaxation time, rotation, time harmonic source in generalized thermoelasticity without energy dissipation respectively. The displacement components \((u \text{ and } w)\) illustrate the
same pattern but having different magnitudes with and without temperature. Conductive temperature $\phi$ shows the different behaviour for two temperature and without two temperatures.
Stress components \((t_{11}, t_{13}, \text{and } t_{33})\) in Figs. 4-6 vary (increases or decreases) during the initial
range of distance near the loading surface of the time harmonic source and follow small oscillatory pattern for rest of the range of distance. Zero value of $\tau_0$ with two temperatures shows more stress near loading surface.

**Sub case ii: Linearly distributed force**

Figs. 7-12 shows the variations of the displacement components ($u$ and $w$), Conductive temperature $\phi$ and stress components ($t_{11}$, $t_{13}$ and $t_{33}$) for transversely isotropic magneto-thermoelastic medium with mechanical force (linearly distributed force) and with combined effects of two temperature, relaxation time, rotation, time harmonic source in generalized thermoelasticity without energy dissipation respectively. The displacement components ($u$ and $w$) and Conductive temperature $\phi$ illustrate the same pattern but having different magnitudes with and without temperature. Stress components ($t_{11}$, $t_{13}$ and $t_{33}$) in Figs. 10-12 varies (increases or decreases) during the initial range of distance near the loading surface of the time harmonic source and follow.

Case II: Thermal source with rotation and with two temperature

Sub case i: Concentrated Force

Figs. 19-24 shows the variations of the displacement components \((u \text{ and } w)\), Conductive temperature \(\varphi\) and stress components \((t_{11}, t_{13} \text{ and } t_{33})\) for transversely isotropic magneto-thermoelastic medium with thermal source (concentrated force) and with combined effects of two temperature, relaxation time, rotation, time harmonic source in generalized thermoelasticity without energy dissipation respectively. The displacement components \((u \text{ and } w)\) and Conductive temperature \(\varphi\) illustrate the same pattern but having different magnitudes with and without temperature. Stress components \((t_{11}, t_{13} \text{ and } t_{33})\) in Figs. 22-24 show the different behaviour for two temperature and without two temperatures.

Sub case ii: Linearly distributed force

Figs. 25-30 shows the variations of the displacement components \((u \text{ and } w)\), Conductive

Fig. 35 Variations of stress component $t_{13}$ with distance $x$
effects of two temperature, relaxation time, rotation, time harmonic source in generalized thermoelasticity without energy dissipation respectively. The displacement components (u and w) and Conductive temperature illustrate the different pattern with and without temperature. Stress components (t_{11}, t_{13} and t_{33}) in Figs. 34-36 show the different pattern with and without temperature. Stress component shows small oscillatory pattern without two temperature and large oscillatory pattern with two temperature.

8. Conclusions

From above research, it is observed that two temperatures and rotation play a key role for the oscillation of physical quantities both close to the point of use of source as well as just as far from the source. The physical quantities amplitude differ with change in two temperatures. In presence of two temperature and time harmonic source, the displacement components and stress components show different nature with respect to x. The result gives an inspiration to study magneto-thermoelastic materials as an innovative domain of applicable thermoelastic solids. The shape of curves shows the impact of two temperatures, relaxation time and rotation with time harmonic source on the body and fulfills the purpose of the study. When sudden heat/external force is applied in a solid body, it transmits time harmonic wave by thermal expansion. The outcomes of this research are extremely helpful in the 2-D problem with dynamic response of time harmonic sources in transversely isotropic magneto-thermoelastic medium with rotation and two temperature which beneficial to detect the deformed field near mining shocks, seismic and volcanic sources, thermal power plants, high-energy particle accelerators, and many emerging technologies.
